

Houston is facing worsening historic flooding in the coming days as Tropical Storm Harvey dumps more rain on the city, swelling rivers to record levels and forcing federal engineers on Monday to release water from area reservoirs in hopes of controlling the rushing currents.

Harvey was the most powerful hurricane to strike Texas in more than 50 years when it came ashore on Friday near Corpus Christi, about 220 miles (354 km) south of Houston, and has killed at least two people. It has since lingered around Texas' Gulf Coast, where it is forecast to remain for several more days, drenching parts of the region with a year's worth of rain in the span of a week.
