

You see, when these scientists detonated the first H-Bomb they were not certain as to whether or not the explosion would be contained. Hydrogen bombs detonate in the atmosphere. The scientists in charge raised some concern that testing the bomb might cause the entire planet to explode in a huge nuclear chain reaction. Yet they went ahead despite this calculated risk! Your government risked your life and the lives of everyone who lived on earth that day. And they risked the lives of everyone who will live on this planet in the future. If you ask me...the people who decided that this would be OK, and the people who followed the orders of the decision makers, should have been charge with war crimes and hanged...or worse!

Today, this risk is being taken without your consent again! Genetically modified crops and livestock are being infused into our food chain, forever changing the genetic makeup of our plants and animals. We have no idea what problems this may cause. We have no idea how this will affect our own health or the health of the ecosystem. We don't know if or how viruses that infect any GM animals may mutate and kill us all. There is a clear risk that if you break one link in the food chain, the entire chain can collapse. And then what?
