

Monsanto's goal is to convert everybody to Roundup Ready crops, buy out all the seed companies, and control the agriculture market

Most Americans have no idea just how pervasive genetically-modified organisms (GMO) have become throughout the food supply. Predatory marketing practices have lured many farmers into converting over to GMOs, and craftily-designed, proprietary growing systems have kept them there. Meanwhile, multinational biotechnology companies like Monsanto effectively seize the reigns of agriculture and dictate how it will proceed from here.

Hart discovers, of course, that GM crops are not all that Monsanto toots them to be. Besides failing to improve crop yields, GM crops require increasingly more pesticide and herbicide applications in order to remain viable. And out of control "superweeds;" escalating prices for seeds, pesticides, and herbicides; and the non-reality of coexistence between GM and non-GM crops are among the many additional problems farmers are facing -- and unfortunately, viable solutions to these problems are largely non-existent.
