

Other areas reporting in to Radiation Station Central, the monitoring assemblage created March 15 to show folks 24/7 radiation readings in the Los Angeles Basin, have sampled and tested rain and snow finding it dozens of times over background. Courtesy of the jet stream pipeline from Fukushima to North America, places like Toronto, Utah, Arizona, North Carolina, Virginia and the Pacific Northwest have all seen high levels of ionizing precipitation.

What we found over our ten-day holiday confirmed that the Midwest was indeed getting pelted by high radiation but in ways we had not anticipated. Places that we thought would be impacted by fallout turned out to be rad-free while others were even hotter than we thought. Even with knowledge and expertise, much gained through conducting over 1,500 radiation tests of rain, fog, food and drink since Radiation Station started March 15, we were still emotionally affected by testing hyper-hot rain falling on the family homestead.
