

In an exciting act of grassroots resistance to Monsanto and their GMOs that are ravaging the planet, activist Adam Eidinge has infiltrated a Monsanto shareholder meeting and posted the video up on Youtube. Eidinge discusses the negative impact of GMO crops, Roundup, and other Monsanto creations on human health and the environment. As a result, a shocked Monsanto spokesman (identified as CEO Hugh Grant by Eidinge) does his best to brush off the concerns and assure the activist that the company — the same company that has been found to be running slave rings on their GMO crop fields — cares very much about the concerns of their shareholders.

One of the major concerns highlighted by activist Adam Eidinge, who identifies himself as an 'occupy activist', is the increased usage of pesticides on crops as a result of Monsanto's failing Bt-infused GMO crops. Bt is a toxin incorporated into genetically modified crops in order to kill different insects, though recently it was exposed that Bt usage has subsequently spawned insect populations which are resistant to the biopesticide. At least 8 populations of insects have developed resistance, with 2 populations resistant to Bt sprays and at least 6 species resistant to Bt crops as a whole.

What is the result? Farmers are being forced to spray substantially more pesticides as a result, leading to further pesticide-laden genetically modified foods being unknowingly consumed by a large number of individuals.
