

Fukushima will start burning radioactive debris containing up to 100,000 becquerels of radioactive cesium per kilogram.

We have now made it more difficult to live on earth and that situation is going to get much worse. There have been severe nuclear accidents before, several very bad ones in Russia and farmers are still feeling the effects of Chernobyl. Hundreds of British sheep farmers still have to obtain a license every time they want to move sheep. Before anything moves off the farm it has to be inspected and scanned with a Geiger counter. That contamination has not gone away; it is still burning people's and animals' bodies and will continue to do that for a long time.

Radioactive hell gets hotter depending on who and where you are, with babies and fetuses suffering the most. As today's essay develops, the story does get worse. No one talks about Fukushima much anymore, but it is one of the most dangerous and significant events in our history. How many of us are going to come down with cancer, go sterile? And what are we going to say to our kids? The world's schools are certainly not teaching their students about it, but that's not surprising since schools do not really educate but instead indoctrinate the young in our civilizations failed ways.
