The chemical to be sprayed is classified by the EPA as a "pesticide" and the plan is to douse cities with this chemical designed to stick on everything for 90 days or longer. This application is not a one time event, but will continue every 1-3 months for as long as five years. The pesticide to be sprayed is not designed to harm the light brown apple moth's who it is designed for, but merely to confuse its mating habits. While harmless to moths, the pesticide has been documented to harm humans.

Side effects range from vomiting and flu like systems, to male and female reproductive cycle disruption. One child nearly died from the exposure, and some people have developed asthma from being exposed to this chemical concoction. It is cause for alarm that a chemical being labeled as harmless and "safe" even in minute doses, causes severe health effects in some people. The government is racing to cover up and hide the dangerous health effects so that they can continue their aerial spray plans this summer.

TVNL Comment: Were you asked about this? Did you vote on this? Do you still believe that we live in a democracy? Do you really believe that the greatest threat to us is terrorism? The greatest threat we face is our ruling class!
