The Federal Trade Commission (FTC) today launched "Operation False Cures," a coordinated scheme to censor natural cancer remedies and financially destroy companies offering them for sale. In doing so, the FTC joins the criminals at the U.S. Food and Drug Administration (FDA) who currently operate an extortion racket that works by threatening health supplement companies with legal action unless they settle with the FDA by paying them million of dollars. Both the FTC and FDA work to protect the interests of the pharmaceutical companies by discrediting or outlawing competing natural cures that work better, more safely and more affordably than FDA-approved pharmaceuticals.

In order to understand what's really going on with the FTC, the key question to ask yourself is simply this: Are there such things as anti-cancer nutrients?

In other words, do anti-cancer nutrients actually exist in the real world?

Of course they do. Broccoli is loaded with them. So is green tea. Zinc is anti-cancer, selenium is anti-cancer, and rainforest herbs are absolutely loaded with anti-cancer nutrients. Vitamin D is such a strong anti-cancer nutrient that, all by itself, it prevents an astonishing 77% of all cancer, and this is all published in peer-reviewed science journals.

Turmeric is anti-cancer, especially when combined with black pepper. So is resveratrol, seaweed, spirulina, chlorella, brown seaweed extract, raw foods, sprouted foods, cabbage, onions, garlic and a thousand other foods.

Now get this: The FTC doesn't believe anti-cancer nutrients exist!
