

Following the release of a new study strongly correlating vitamin D deficiency with Parkinson's disease, the mainstream media (MSM) has once again gone out of its way to intentionally distort the findings of the study and mislead readers about vitamin D. The study was conducted by Emory University, the same university that has just had \$9.3 million in NIH grants frozen because of undisclosed ties between its researchers and the drug companies (http://www.naturalnews.com/News_000362_...).

Thus, from the start, we already know that Emory University researchers are working for Big Pharma and likely have a financial stake in promoting pharmaceuticals or discrediting natural alternatives.
